

METHOD AND SYSTEM FOR SEARCHING FOR DRAWING NUMBERS

ABSTRACT

A method and system for searching for drawing numbers related to a device, such as a generator. The drawing number search system receives information relating to a generator, which may include the cooling method of the generator and either a generator type or a shop order identification. The system also receives a part name or other identification. When the information has been received, the drawing number search system accesses a database and determines the drawing number associated with the generator and the part name. The system then transmits the results to a user. The drawing number search system may be implemented in a client/server environment, such as a web-based environment over the Internet or an intranet. In such an environment, a web server provides the various components of the drawing number search system.
